

Extra Credit Problem 1B

Complete within 60 minutes for 2 points. You may only have gedit and a terminal window open on your computer and must complete all work independently.

Problem: Recreate the form of the **range** function that accepts two arguments.

Task: Write a python function named **myRange** that accepts integer values for start and end. The function returns a list beginning at the start value and ending at *end-1*.

Do not call python's range function within your code.

The function must perform correctly for any integer inputs. You may assume that input values are integers. Test the function to ensure that it behaves exactly as python's range function does.
